ABSTRACT

The third Saturn IB vehicle, AS-202, was launched from KSC pad 34 at 12:15:32 EST on August 25, 1966. This report presents the AS-202 postflight trajectory from guidance reference release (approximately 5 sec prior to vehicle first motion) to S-IVB/CSM separation. The trajectory is presented in the earth-fixed plumbline, space-fixed ephemeris, and geographic coordinate systems. A complete time history of trajectory parameters is given, in tabular form, at 1 sec intervals through S-IB powered flight and 5 sec intervals through S-IVB powered flight to S-IVB/CSM separation. Also included are tabulations of the S-IB and S-IVB stages ballistic trajectories. Some special trajectory dependent parameters are presented in graphic form.

SUMMARY

This report presents the AS-202 postflight trajectory. The powered flight trajectory was established from the data provided by external electrical tracking systems and the onboard telemetry system. External tracking data were available from ODOP, GLOTRAC Station I, GLOTRAC, and C-Band radar tracking systems. The onboard data consisted of telemetered guidance information obtained from the ST-124M platform. The ODOP and GLOTRAC Station I data were used to construct the S-IB portion of the powered flight trajectory. Telemetered guidance information, reduced to inertial velocities, was used in conjunction with C-Band radar tracking data to produce a best estimate trajectory for the S-IVB powered flight. The trajectory is presented from guidance reference release (4.468 sec prior to the established Range Zero time of 12:15:32 EST) to S-IVB/CSM separation (598.7 sec after Range Zero). An error analysis of the trajectory is included. Tables and figures present the data in both the metric and English units of measure.

1.0 INTRODUCTION

The AS-202 vehicle was launched from KSC on August 25, 1966, at 12:15:32 EST. After approximately 9 min and 48 sec of powered flight and 10 sec of free flight the S-IVB stage and Apollo spacecraft separated. After separation the Apollo spacecraft was put through a series of tests.

The AS-202 vehicle was the third flight test of the Saturn IB series and the thirteenth of the Saturn family of vehicles. This was the second flight test of the Apollo spacecraft.

This report presents the postflight mass point reference trajectory and associated information from guidance reference release to S-IVB/CSM separation, in Tables VI through XI. Also presented are detailed discussions of data sources and their utilization, an error analysis along with the estimated uncertainty of the trajectory, and free flight trajectories for the S-IB and S-IVB stages. Several trajectory dependent illustrations are included. A few points from the spacecraft trajectory as determined by MSC are included in Appendix A.

Times listed in this report are referenced to Range Zero (12:15:32 EST) unless otherwise specified. The times of guidance reference release and first motion were defined as 4.468 sec before and 0.73 sec after Range Zero, respectively.

Acknowledgement is given to the Dynamics Programming Unit of CCSD Computer Services for their invaluable assistance in processing the data presented in this report.

2.0 COORDINATE SYSTEMS AND TRAJECTORY PARAMETERS

The translational motion of the vehicle's center of gravity is tabulated in three coordinate systems: earth-fixed plumbline, space-fixed ephemeris, and geographic. An initial displacement of 32.0 m (105.0 ft) locates the center of gravity of the vehicle in the earth-fixed plumbline system whose origin is located on the reference earth model. The above coordinate systems are defined in Appendix A and graphically illustrated in Figure 3.

The representative model for the earth and its gravitational field is the Fischer Ellipsoid of 1960. All latitude and longitude coordinates are defined with respect to this ellipsoid.

The geographic coordinates and gravity data for launch pad 34 at Cape Kennedy are:

Geodetic Latitude	28.521963 deg N
Longitude	80.561141 deg W
Acceleration of Gravity	9.818 m/s ² (32.21 ft/s ²)

Elevations above the reference ellipsoid are:

Base of Launch Pedestal	5.7 m (18.7 ft)
C.G. at First Motion	32.0 m (105.0 ft)

Azimuth alignments are:

Launch Azimuth	100.0 deg E of N
Flight Azimuth	105.0 deg E of N
ST-124M Platform Azimuth	105.0 deg E of N

3.0 POWERED FLIGHT TRAJECTORY ANALYSIS

3.1 Data Sources

Tracking data were available from first motion through S-IVB/CSM separation. The tracking coverage of each tracking system is itemized in Table I and shown in Figure 1. The vehicle ground track relative to the tracking stations is shown in Figure 2. Figure 4 shows the vehicle station location of each antenna for the various tracking systems and the vehicle's center of gravity versus time. Comparison of each individual tracking system with the reference postflight trajectory is discussed below. The metric comparisons are shown in Figures 11 through 13. The measured parameter comparisons are shown in Figures 14 through 16.

3.1.1 ODOP

The ODOP tracking data were used in establishing the reference trajectory from first motion through 125 sec. The ODOP data were processed in the Final Launch Phase program to produce the initial portion of the trajectory, from first motion to 29 sec. The data from the Final Launch Phase program were then merged at 29 sec with the regularly processed ODOP data. The ODOP tracking system furnished continuous data from 0 to 132 sec as shown in Figure 1.

3.1.2 GLOTRAC Station I (Mark II AZUSA)

GLOTRAC Station I furnished an independent set of tracking data. These data were received from 15 to 234 sec and were incorporated

in the reference trajectory from 125 to 160 sec. Comparison of these data with the reference trajectory reveals deviations of less than 16 m (52 ft), 11 m (36 ft), and 7 m (23 ft) in the XE, YE, and ZE position components, respectively.

3.1.3 GLOTRAC

GLOTRAC data were received from 20 sec through the remaining powered flight. These data were the only high precision data received after 235 sec. However, these data were not incorporated into the reference trajectory due to late arrival and a close correlation with the reference trajectory. Comparisons between GLOTRAC and the reference trajectory revealed deviations of less than 45 m (148 ft) in the position components.

3.1.4 Radar

Grand Bahama (3.18) radar tracking covered the major portion of the powered flight. The data received started at 90 sec and continued beyond S-IVB/CSM separation. The angle measurements displayed deviations of less than 0.01 and 0.03 deg in azimuth and elevation, respectively. The range measurement had a maximum deviation of approximately 28 m (92 ft).

The tracking data from the Grand Turk (7.18) radar were received from 217 sec through the remaining powered flight with one gap from 478.2 to 480.5 sec. The maximum angle deviations were 0.007 and 0.013 deg in azimuth and elevation, respectively. The maximum range deviation was 12 m (39 ft) from the reference trajectory.

Merritt Island (19.18) radar tracked from 14 to 468 sec of the flight. The azimuth, elevation and range measurements revealed

errors of 0.01 deg, 0.03 deg and 30 m (98 ft), respectively, from the reference trajectory.

Patrick (0.18) radar furnished data until 568 sec of flight. These data displayed maximum deviations of 0.01 deg, 0.017 deg and 21 m (69 ft) in azimuth, elevation and range, respectively, with respect to the reference trajectory.

Antigua (91.18) radar provided data from 483 sec to beyond S-IVB/CSM separation. The angle measurements had a maximum deviation of 0.01 deg in azimuth and 0.014 deg in elevation. The range measurement revealed a deviation of 60 m (197 ft).

The Grand Bahama (3.16) radar furnished reliable tracking data from 88 to 611 sec of the AS-202 flight. These data revealed deviations of less than 0.007 deg, 0.012 deg and 32 m (105 ft), respectively, in azimuth, elevation and range with one data gap from 98 to 110.1 sec.

The Cape Kennedy (1.16) radar data were received from 13 to 210 sec. These data had two short gaps occurring from 35.8 to 41 sec and 53.7 to 58 sec. The maximum deviations in azimuth, elevation and range were 0.026 deg, 0.005 deg and 14 m (46 ft), respectively.

3.2 Trajectory Composition

External tracking systems provided data which were used in conjunction with telemetered guidance velocities in establishing the reference trajectory. The trajectory was constructed in the following manner.

<u>Interval (sec)</u>	<u>Description</u>
0.0 - 29.0	ODOP data were used in a least squares curve fit. (Reference 1 discusses in detail the method used to establish this portion of the trajectory.)
29.0 - 125.0	ODOP data processed by the Smoothing and Differentiation program, which is discussed below.
125.0 - 160.0	GLOTRAC Station I data processed by the Smoothing and Differentiation program. The S-IB cutoff area was adjusted to the guidance velocity and acceleration profiles using telemetered data.
160.0 - 598.7	A best estimate type trajectory, as generated by the MARLOCK program, using C-Band radar and telemetered guidance data. The technique is discussed below.

The initial portion of the reference trajectory was established with the Final Launch Phase program. The program utilized ODOP data in a least squares curve fit. The differences between the resulting curve and the actual data were negligible. The remaining powered flight portion of the S-IB trajectory was established using ODOP and GLOTRAC Station I data. The S-IVB powered portion of flight to S-IVB/CSM separation is a best estimate type trajectory from all tracking systems.

The best estimate trajectory is established through utilization of the MARLOCK program. The MARLOCK program uses telemetered guidance velocities as a generating parameter to compute a trajectory which will best fit the tracking data yet retain the smoothness of the guidance data. The guidance data can vary only in accordance with an eighteen term error model and the variances assigned to each error coefficient. The error coefficients are determined using the Kalman linear filtering technique and the error terms are applied to the guidance data to produce the final

smooth and continuous trajectory (See Reference 2 for a theoretical discussion of the MARLOCK program).

The ODOP, GLOTRAC Station I data and computed trajectory were smoothed over a 10 sec span using coefficients which are the average of fourth-degree and second-degree smoothing coefficients. The averaged coefficients provide a more desirable frequency response for tracking data filtering. The velocity and acceleration data were derived using fourth-degree coefficients because significant bias could be induced if averaged coefficients were used. Reference 3 presents a detailed discussion of the Smoothing and Differentiation program.

All observed data were transformed from the point of track (antenna locations on vehicle) to the vehicle's center of gravity to provide a common point of reference for all of the tracking systems.

Since several data sources were used to construct the trajectory, it was necessary to provide a merging or blending process to compensate for the small biases that may have existed between the data sources. A merging program (a least squares technique) was used to connect the different data sources in order to create a smooth transition.

3.3 Powered Flight Trajectory

A comparison of actual and nominal times at significant vehicle events is presented in Table II. Altitude and surface range are shown in Figures 5 and 6, respectively, for the entire powered flight. Figure 7 is an illustration of the total inertial acceleration profiles for the S-IB and S-IVB stages. The earth-fixed velocity magnitude, along with the angle between the earth-fixed velocity vector and the local horizontal plane, is shown in Figure 8. The magnitude of the space-fixed velocity

vector and the angle between the space-fixed velocity vector and the local horizontal plane is shown in Figure 9. Mach number and dynamic pressure are shown for the S-IB powered flight in Figure 10. These parameters were calculated using measured meteorological data to an altitude of 83 km (45 nm). Above this altitude the U.S. Standard Reference Atmosphere was used.

Various trajectory parameters are given at significant event times in Table III. Apex, loss of telemetry, and impact are included for the discarded S-IB stage. Only the apex and loss of telemetry are included for the S-IVB stage. Several trajectory parameters are given at inboard engine cutoff (IECO), outboard engine cutoff (OECO) and S-IVB cutoff (S-IVB CO) in Table IV and at S-IB/S-IVB and S-IVB/CSM separations in Table V. The velocity gain between OECO and separation due to thrust decay was 4.6 m/s (15.1 ft/s). The velocity gain from S-IVB CO to end of thrust decay was 6.2 m/s (20.3 ft/s).

The actual powered flight trajectory is presented in the metric system of units in Tables VI through VIII, and the English system of units in Tables IX through XI.

3.4 Error Analysis of the Reference Trajectory

During the S-IB powered flight, excellent coverage was provided by ODOP and GLOTRAC Station I. These two sets of data were used to establish the reference trajectory during this portion of the flight.

Data from the ODOP, GLOTRAC Station I, and GLOTRAC systems are compared to the reference trajectory in the earth-fixed plumbline coordinate system in Figures 11 through 13. All data were smoothed, differentiated and transferred from the point of track (vehicle antenna locations) to a common point, the vehicle's center of gravity. The

earth-fixed plumbline comparisons show negligible differences between the high precision systems during the first stage portion of the flight and less than 45 m (148 ft) deviation through the entire powered flight. Comparisons of radar measured parameters (azimuth, elevation, and range) with the reference trajectory are presented in Figures 14 through 16. This comparison reveals maximum deviations of 60 m (197 ft) in the range measurements for any system. Maximum deviations for azimuth and elevation are 0.026 deg and 0.03 deg, respectively. All range and angle measurements appear to be biased or show systematic trends with respect to the reference trajectory. The dispersion of the various data gives an indication of the accuracy of the reference trajectory. The comparison curves show only the trend of the data relative to the reference trajectory.

A statistical analysis of ten different MARLOCK trajectory solutions was performed in an effort to determine trajectory accuracies. From this analysis the standard deviations at S-IVB/CSM separation were:

XE	YE	ZE
28.6 m (93.8 ft)	102.4 m (336.0 ft)	8.9 m (29.2 ft)
DXE	DYE	DZE
0.09 m/s (0.30 ft/s)	0.87 m/s (2.85 ft/s)	0.24 m/s (0.79 ft/s)

An estimate of the probable total uncertainty in the powered flight reference trajectory is presented in Figure 17. At OECO the position components are probably accurate to 30 m (98 ft) and the velocity components to 0.3 m/s (1.0 ft/s). By S-IVB CO the velocity uncertainties have increased to about 1.0 m/s (3.3 ft/s) in the DYE component and 0.5 m/s

(1.6 ft/s) in the D_XE and D_YE components. The uncertainties in position components at S-IVB CO are 200 m (656 ft) in the Y_E component and 100 m (328 ft) in the X_E and Z_E components.

4.0 S-IB AND S-IVB STAGE FREE FLIGHT TRAJECTORIES

A theoretical free flight trajectory was computed for the discarded S-IB stage using initial conditions following outboard engine thrust decay and retro-rocket cutoff. The initial conditions were computed by assuming nominal retro-rocket performance and outboard engine thrust decay after S-IB/S-IVB separation. Radar tracking data were not available to confirm the results obtained.

A nominal tumbling drag was assumed following the retro-rocket cutoff. In addition, nominal coefficients of drag were used assuming the booster (1) stabilized at 90 deg angle of attack and (2) stabilized at 0 deg angle of attack. These provide the following dispersions:

<u>Drag Conditions</u>	<u>Impact Range</u>	<u>Impact Time</u>
0 deg Angle of Attack	460.1 km (248.4 nm)	476.3 sec
Tumbling	450.0 km (243.0 nm)	536.8 sec
90 deg Angle of Attack	443.4 km (239.4 nm)	578.2 sec

A theoretical free flight trajectory was computed for the discarded S-IVB stage using initial conditions from the reference trajectory. This trajectory was computed to the loss of telemetry signal which occurred simultaneously with the termination of the common bulkhead pressure test at 941.2 sec. At loss of telemetry, the S-IVB stage was at an altitude of 246.1 km (132.9 nm) and surface range of 3708.2 km (2002.3 nm).

Since the S-IVB stage had not re-entered the Earth's atmosphere at the time of loss of telemetry, the various coefficients of drag would result in negligible variations in the free flight trajectory. Therefore, only the tumbling drag coefficient was used to compute the free flight trajectory for the S-IVB stage.

The theoretical free flight trajectory utilizing the tumbling drag coefficient data will be considered as the actual trajectory for the S-IB stage. The S-IB stage trajectory is presented in tabular form in Tables XII (metric units) and XIV (English units). The S-IVB stage trajectory is presented in tabular form in Tables XIII (metric units) and XV (English units). The ground track of the trajectories are shown in Figure 2.

APPENDIX B

DEFINITIONS OF SYMBOLS

<u>Symbol</u>	<u>Definitions</u>
XE, YE, ZE	Position, velocity and acceleration components in the <u>Earth-Fixed Cartesian Coordinate System</u> . The origin of this system is the projection of the center of gravity of the complete vehicle at first motion onto the Fischer Ellipsoid of 1960. The X-Z plane is tangent to the reference ellipsoid at the origin of the coordinate system. The positive X-axis is oriented in the flight azimuth direction, 105 deg E of N. The Y-axis is normal to the X-Z plane and is positive above the origin. The Z-axis is normal to the X-Y plane and is in a right hand relation to the X-Y axes with the positive direction 195 deg E of N. The origin of this earth-fixed system rotates with an angular velocity identical to that of the earth. The earth-fixed coordinate system is shown in Figure 3.
XSP, YSP, ZSP	Position, velocity and acceleration components in the <u>Space-Fixed Ephemeris Coordinate System</u> . The origin of this system is located at the geocentric center of the earth. The Z-axis points north along the earth's axis of rotation (through the north pole). The X-Y plane is coincident with the equatorial plane. The X-axis points through the vernal equinox. The reference equinox and equator are the mean equinox and equator of date for the epoch of midnight or zero hours on the day of launch. The Y-axis is normal to the X-Z plane and in a right hand relation to the X-, Z-axes. The direction of the coordinate axes remain fixed in space although the origin continues to move with the center of the earth. The space-fixed ephemeris coordinate system is shown in Figure 3.
E. C. DIST	Position of vehicle in the <u>Geographic Coordinate System</u> . Position in this system is defined by the radius vector from the vehicle to the geocentric center of the earth (E.C.DIST), geocentric latitude (G.C. LAT) and longitude (LONG). Geocentric latitude is the angle between the radius vector and the equatorial plane, positive north of the equator. Longitude is the angle between the projection of the radius vector into the equatorial plane and the Greenwich meridian, measured positive east of the Greenwich meridian.
LONG	
G.C. LAT	

DEFINITIONS OF SYMBOLS (CONT'D)

<u>Symbols</u>	<u>Definitions</u>
E.F. VEL	Earth-fixed velocity of the vehicle in the <u>Geographic Coordinate System</u> . Velocity in this system is given in terms of azimuth (VEL-AZ), elevation (VEL-ELEV), and magnitude of the velocity vector (E.F.VEL). Azimuth is the angle between the projection of the velocity vector into the local horizontal plane and the north direction in this plane. Elevation is the angle between the velocity vector and the local horizontal plane. The local horizontal plane is defined as the plane perpendicular to the <u>radius vector from the vehicle to the geocentric center of the earth</u> . The geographic coordinate system is shown in Figure 3.
S.F. VEL	Space-fixed velocity of vehicle in the Geographic Coordinate System. Velocity is given in terms of flight-path angle (FLT-PATH), heading angle (HEAD), and magnitude of the velocity vector (S.F.VEL). The flight-path angle is the angle between the space fixed velocity vector and the plane normal to the radius vector from the vehicle to the geocentric center of the earth, measured positive upward from this plane. The heading angle is measured positive clockwise from north to the projection of the space-fixed velocity vector in the plane normal to the radius vector.
LAT	Geodetic latitude of vehicle.
MACH	Mach number.
DYN PRES	Dynamic Pressure.
ALTITUDE	Distance from the reference ellipsoid to the center of gravity of the vehicle measured along the radius vector from the vehicle to the geocentric center of the earth.
RANGE	Surface range measured along a spherical earth from the launch site to the subvehicle point. The subvehicle point is defined as the intersection of the reference ellipsoid and the reference ellipsoid normal passing through the vehicle.
DEC	The Declination angle is the angle between the radius vector from the center of the earth to the vehicle and the equatorial plane, positive north of the equator (Synonymous with G.C. LAT).
